### 1. INTRODUCTION

In this paper, we introduced the concepts of new separation axioms called M\*-separation axioms i.e. M\*-T<sub>1/2</sub>, M\*-T<sub>b</sub>, M\*-T<sub>d</sub> by using M\*-open sets due to Palaniappan et al. [1] in topological space and obtained several properties of such spaces. In 2012, Carpintero et al. [2] introduced a new separation axioms i.e. b-  $\gamma$ -T<sub>0</sub>, b-  $\gamma$ -T<sub>1</sub>, b-  $\gamma$ -T<sub>2</sub> in topological spaces by using b-open,  $\gamma$ -open sets and obtained several properties of such spaces.

### 2. PRELIMINARIES

#### 2.1 Definition

A subset A of a topological space X is called

- (i)  $\alpha^*$ - set [3], if  $\text{int}(\text{cl}(\text{int}(A))) = \text{int}(A)$ .
- (ii) C - set [3], if  $A = U \cap V$ , where U is an open and V is an  $\alpha^*$  - set in X.
- (iii)  $\alpha\text{Cg}$  - closed [4], if  $\alpha - \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and U is C - set in X.
- (iv) M\*-closed [1], if  $\alpha - \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and U is  $\alpha\text{Cg}$  - open in X.
- (v) M\*g - closed [5], if  $M^* - \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and U is open in X.
- (vi) gM\* - closed [5], if  $M^* - \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and U is M\*-open in X.

The complement of  $\alpha\text{Cg}$  - closed (resp. M\* - closed, M\*g - closed, gM\*- closed) set is said to be  $\alpha\text{Cg}$  - open (resp. M\* - open, M\*g - open, gM\*- open) set. The intersection of all M\*- closed subsets of X containing A is called the M\*- closure of A and is denoted by M\*- cl(A). The union of all M\*- open subsets of X in which are contained in A is called the M\*- interior of A and is denoted by M\*- int(A). The family of M\*- open (resp. M\* -

closed) sets of a topological space  $X$  is denoted by  $M^*O(X)$  (resp.  $M^*C(X)$ ).

## 2.2. Remarks

### Remark 2.2.1. [1]

Every  $\alpha$ -closed (resp.  $\alpha$ -open) set is  $M^*$ - closed (resp.  $M^*$ -open) set.

For definitions stated above, we have the following diagram:

However the converses of the above are not true as may be seen by the following examples:

Example 2.2.1: Let  $X = \{a, b, c, d\}$  and  $\tau = \{\phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, X\}$ . Then  $A = \{c\}$  is  $\alpha$ - closed set as well as  $M^*$ - closed set but not closed set in  $X$ .

Example 2.2.2: Let  $X = \{a, b, c, d\}$  and  $\tau = \{\phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, X\}$ . Then the set  $A = \{c\}$  is  $gM^*$ - closed set but not closed set in  $X$ .

### Remark 2.2.2.

- (i) A subset  $A$  of  $X$  is  $M^*g$ -open in  $X$  iff  $F \subset M^*\text{-int}(A)$  whenever  $F \subset U$  and  $F$  is closed in  $X$ .
- (ii) A subset  $A$  of  $X$  is  $gM^*$ -closed (resp.  $gM^*$ - open) in  $X$  iff  $A$  is  $g$ -closed (resp.  $g$ -open) in  $X$ .

## 3. $M^*-T_1, M^*-T_{1/2}, M^*-T_b, M^*-T_d$ - SPACES

### 3.1. Definition

A topological space  $X$  is said to be

- (i)  $T_1$  (resp.  $M^*-T_1$ ), if for any distinct pair of points  $x$  and  $y$  in  $X$ , there exists an open (resp.  $M^*$ -open) set  $U$  in  $X$  containing  $x$  but not  $y$  and open (resp.  $M^*$ - open) set  $V$  in  $X$  containing  $y$  but not  $x$ .
- (ii) A  $T_{1/2}$  [6], if every  $g$ -closed set is closed.
- (iii) A  $M^*-T_{1/2}$ , if every  $gM^*$ -closed set is  $M^*$ -closed.
- (iv) A  $M^*-T_b$ , if every  $M^*g$ - closed set in  $X$  is closed.
- (v) A  $M^*-T_d$ , if every  $M^*g$ - closed set in  $X$  is  $g$ - closed.

$$\begin{array}{c}
 T_1 \Rightarrow T_{1/2} \Leftarrow M^*-T_b \Rightarrow M^*-T_d \\
 \Downarrow \quad \Downarrow \\
 M^*-T_1 \Rightarrow M^*-T_{1/2}
 \end{array}$$

It can be explained by the following example:

**Example 3.1.1:** A  $M^*-T_b$  space need not be  $M^*-T_1$ . Let  $X = \{a, b, c\}$  and  $\tau = \{\phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, X\}$ . Since  $\{b\}$  is not  $M^*$ - closed it is not  $M^*-T_1$  and hence it is not  $T_1$ . However the family of all  $M^*g$ - closed sets coincides with one of all closed sets and hence it is a  $M^*-T_b$ .

### 3.2. Theorems

#### Theorem 3.2.1.

- (i)  $X$  is a  $T_{1/2}$  iff for each  $x \in X$ ,  $\{x\}$  is open or closed in  $X$ .
- (ii)  $X$  is a  $M^*-T_{1/2}$  space iff for each  $x \in X$ ,  $\{x\}$  is  $M^*$ -open or  $M^*$ - closed in  $X$ , i.e.,  $X$  is a  $M^*-T_{1/2}$  iff a space  $(X, \tau^{M^*})$  is  $T_{1/2}$  - space.

#### Theorem 3.2.2.

- (i) If  $A$  is  $M^*g$ -closed, then  $M^*\text{-cl}(A) - A$  does not contain non-empty closed set.
- (ii) For each  $x \in X$ ,  $\{x\}$  is closed or its complement  $X - \{x\}$  is  $M^*g$ -closed in  $X$ .
- (iii) For each  $x \in X$ ,  $\{x\}$  is  $M^*$ -closed or its complement  $X - \{x\}$  is  $gM^*$ -closed in  $X$ .

#### Theorem 3.2.3

- (i) Every  $M^*-T_b$  space is  $M^*-T_d$  and  $T_{1/2}$ .
- (ii) Every  $T_i$  - space is  $M^*-T_i$ , where  $i = 1, 1/2$ .
- (iii) Every  $M^*-T_i$  space is  $M^*-T_{1/2}$ .

#### Proof:

- (i) It is obtained from **Definition 3.1.** [(ii), (iv) and (v)] and **Remark 2.2.2.** (i), (ii).
- (ii) Let  $X$  be a  $T_1$  (resp.  $T_{1/2}$ ) - space and let  $x \in X$ . Then  $\{x\}$  is closed (resp. open or closed) by **Theorem 3.2.2.** (i). Since every open set is  $M^*$ -open,  $\{x\}$  is  $M^*$ -closed (resp.  $M^*$ -closed or  $M^*$ -open) in  $X$ . This implies that  $X$  is  $T_1$  (resp.  $T_{1/2}$ ) by **Theorem 3.2.2** (ii) Therefore  $X$  is  $M^*-T_1$  (resp.  $M^*-T_{1/2}$ ).
- (iii) Let  $X$  be a  $M^*-T_1$  space. Then  $X$  is  $T_1$ . By **Theorem 5.3** of [6]  $X$  is  $T_{1/2}$  and hence  $X$  is  $M^*-T_{1/2}$ .

### 3.3. Proposition

- (i) If  $X$  is  $M^*-T_b$  then for each  $x \in X$ ,  $\{x\}$  is  $M^*$ -closed or open in  $X$ .
- (ii) If  $X$  is  $M^*-T_d$  then for each  $x \in X$ ,  $\{x\}$  is  $M^*$ -closed or  $g$ -open in  $X$ .

**Proof:**

- (i) Suppose that, for an  $x \in X$ ,  $\{x\}$  is not  $M^*$ -closed. By **Theorem 3.2.2** (iii) and **Remark 2.2.2** (i) and (ii),  $X - \{x\}$  is  $M^*g$ -closed set. Therefore  $X - \{x\}$  closed by using assumption and hence  $\{x\}$  is open.
- (ii) Suppose that, for a  $x \in X$ ,  $\{x\}$  is not closed. By **Theorem 3.2.2** (ii),  $X - \{x\}$  is  $M^*g$ -closed set. Therefore by using assumption  $X - \{x\}$  is  $g$ -closed and hence  $\{x\}$  is  $g$ -open.

### 4. SEPARATION AXIOMS $M^*-T_b$ , and $M^*-T_d$ of SPACES ARE PRESERVED UNDER HOMOMORPHISMS

#### 4.1. Definition

A map  $f: X \rightarrow Y$  is said to be

- (i) **pre  $M^*$ -closed** if for each  $M^*$ -closed set of  $X$ ,  $f(F)$  is  $M^*$  - closed set in  $Y$ .
- (ii)  **$M^*$  - irresolute** if for each  $M^*$ -closed set  $F$  of  $Y$ ,  $f^{-1}(F)$  is  $M^*$ -closed in  $X$ .

#### 4.2. Theorems

##### Theorem 4.2.1.

- (i) A map  $f: X \rightarrow Y$  is pre  $M^*$ -closed (resp. pre  $M^*$ -open) iff its induced map  $f: (X, \tau^{M^*}) \rightarrow (Y, \sigma^{M^*})$  is a closed (resp. open) map.
- (ii) A map  $f: X \rightarrow Y$  is  $M^*$ -irresolute iff its induced map  $f: (X, \tau^{M^*}) \rightarrow (Y, \sigma^{M^*})$  is continuous.

##### Theorem 4.2.2.

- (i) A map  $f: X \rightarrow Y$  is a homomorphism, then  $f$  is a  $M^*$ - homomorphism.
- (ii) If  $X$  is  $M^*-T_b$  (resp.  $M^*-T_d$ ) and  $f: X \rightarrow Y$  is a homomorphism, then  $Y$  is  $M^*-T_b$  (resp.  $M^*-T_d$ ).

**Proof:**

- (i) Since  $f: X \rightarrow Y$  is a homomorphism, then  $f$  and  $f^{-1}$  are both open and  $M^*$ -continuous bijection. It follows from **Theorem 4.16** of Noiri [7] that  $f$  and  $f^{-1}$  are  $M^*$ -irresolute. Therefore,  $f$  is  $M^*$ -irresolute and  $f$  is pre  $M^*$ -closed.

- (ii) Let  $f: X \rightarrow Y$  is a homomorphism and let  $F$  be a  $M^*$ -g-closed set of  $Y$ . Then by (i)  $f^{-1}: Y \rightarrow X$  is a continuous and pre  $M^*$ -closed bijection. Hence by **Theorem 4.2.1**, (i),  $f^{-1}(F)$  is  $M^*$ -g-closed in  $X$ . Since  $X$  is  $M^*$ - $T_b$  (resp.  $M^*$ - $T_d$ ),  $f^{-1}(F)$  is closed (resp. g-closed) in  $X$ . Since  $f$  is closed onto (resp. closed and continuous) map,  $F$  is closed (resp. g-closed) by **Theorem 6.1** [6] in  $Y$ . Hence  $Y$  is  $M^*$ - $T_b$  (resp.  $M^*$ - $T_d$ ).
